

## **KALGUN - GC**

### **Gunning refractory castables**

They are hydraulically bound refractory materials which can be used in machine coating of the lining by the means of pressure air-gunitting. The gunitting allows rapid repair work on older damaged linings. The repairs made by gunitting can be realized under hot and cold conditions. This means prolongation of lifetime of hot aggregates without any longer stand times.

### **Applications:**

furnaces in non-ferrous industry, forge furnaces, malleableizing, heating furnaces, furnaces in chemical and oil industry, steam boilers, chimneys, dust-collecting chambers, linings in pit furnaces, push furnaces.
